1.Open the command prompt and use the ipconfig tool to find your computer's IPv4 address and default gateway, then take a screenshot of the output.

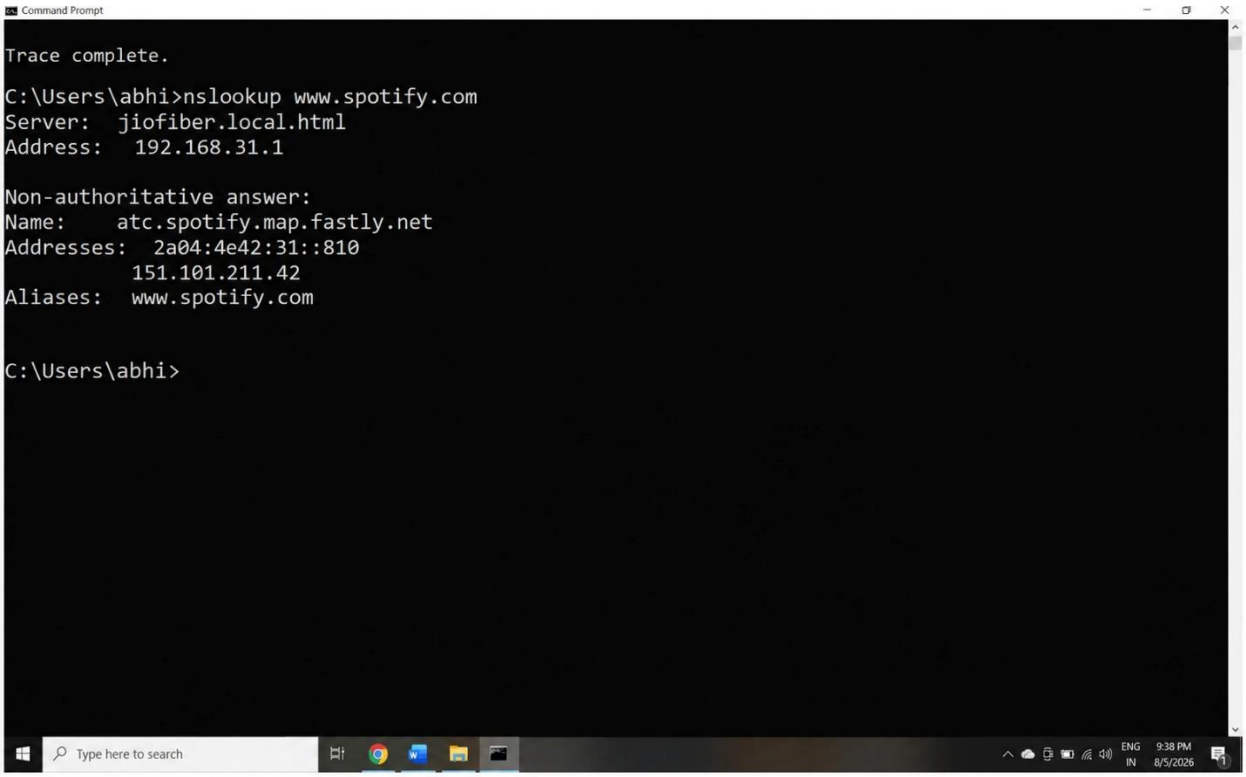

2.Use the ping command to check the connectivity between your computer and www.google.com, then note down the average response time shown.

3.Run the tracert (or traceroute on Linux/Mac) command to www.flipkart.com and list the number of hops it takes to reach the destination.

4.Use the nslookup tool to find the IP address of www.spotify.com and explain in one line what this tool helps you verify.

5.A friend says they cannot access Zomato’s website from their laptop. Suggest a sequence of three troubleshooting commands (choose from: ping, ipconfig, tracert, nslookup) you would run to diagnose the issue, and

briefly state what each command would help you check.Hint: Think about checking both network connectivity and DNS resolution.

Command	What it checks
ipconfig	Verifies the laptop has a valid IPv4 address, subnet mask, and default gateway, confirming it is connected to the network.
nslookup www.zomato.com	Checks whether DNS is working by resolving the Zomato domain name to an IP address.
ping www.zomato.com	Tests whether the laptop can reach Zomato's server and measures the response time.
